

Exposure to COVID-19 Guidelines

You have been exposed to someone with COVID-19. Depending on whether you are asymptomatic (without symptoms) or symptomatic (with symptoms e.g. fever, cough, short of breath, or loss of taste and/or smell) you may be asked to quarantine or isolate. It is important to finish out your quarantine or isolation period to help slow the spread of COVID-19.

Asymptomatic (without symptoms) Exposed Individual

If you have been in close prolonged contact (within six feet for at least 15 minutes within a 24 hour period) and remain asymptomatic you will need to enter quarantine based on the following options:

- 14-day quarantine period remains the CDC recommendation for the greatest protection against spread of COVID-19.
- Minimum seven-day quarantine with negative COVID-19 test collected on day 5 or later
- 10-day quarantine with no test

Exceptions are as follows:

- 14-day quarantine for individuals exposed to a COVID-19 positive household member
- 14-day quarantine if you are a resident of a congregate care and congregate living setting.
- 14-day work exclusion if you work in health care, congregate care, or congregate living. Community activities for this group can be resumed based on options above.

It is important to continue to monitor for symptoms until day 14 post exposure. If any symptoms consistent with COVID-19 develop during your quarantine period, contact the Nurse Triage Line: 320-373-1026 to review symptoms and determine if you need to be retested for COVID-19.

If you are tested and the results are **negative**, you should continue to prevent yourself and others from getting COVID-19 through the list of prevention steps listed in this document. It is important to finish out your quarantine period even if you do not develop symptoms as you can still spread the virus to others

If you tested **positive** for the COVID-19 virus and remain **ASYMPTOMATIC**, home isolation is recommended until at least 10 days have passed since the date of your first positive test and

you continue to have no symptoms (no cough or shortness of breath) since the test. Home isolation consists of separating yourself from other household family members as much as possible.

Symptomatic (with symptoms) Exposed Individual

If you develop symptoms during your quarantine, and it is recommended to be tested/retested, ***all members of your household must stay home until your results are known.***

If you test positive and are symptomatic, you should continue isolation until these three things have happened:

1. You have had no fevers for at least 24 hours without the use of medication that reduces fever
AND
2. Improvement of Symptoms
AND
3. At least 10 days have passed since your symptoms first appeared.

Even if you test ***negative*** and are symptomatic, you will need to follow the guidelines outlined above due to having a known exposure to someone diagnosed with COVID-19.

Stay home except to get medical care

You should restrict activities outside your home, except to get medical care. Do not go to work, school, or public areas. Avoid using public transportation, ridesharing, or taxis.

Monitor for Symptoms

Seek prompt medical attention if you develop **severe** symptoms (e.g., difficulty breathing).

Before seeking care, call your healthcare provider and tell them that you have tested positive for COVID-19 or have been exposed to someone with COVID-19. Put on a face covering over your mouth and nose before you enter the facility. If you have a medical emergency and need to call 911, **notify the dispatch personnel that you have, or are being evaluated for COVID-19.** If possible, put on a face covering before emergency medical services arrive.

Prevention Steps and Self-Care at Home if COVID-19 Positive

Separate yourself from other people and animals in your home

As much as possible, you should stay in a specific room and away from other people in your home. Also, you should use a separate bathroom and bedroom, if available.

Call ahead before visiting your doctor

If you have a medical appointment, call the health care provider and tell them that you have symptoms of COVID- 19 or tested positive. This will help the healthcare provider's office take steps to keep other people from getting infected or being exposed.

Wear a face covering

You should wear a face covering when you are around other people including your household contacts (e.g., sharing a room or vehicle) or pet and before you enter a healthcare provider's office. If you are not able to wear a face covering (for example, because it causes trouble

breathing), then people who live with you should not stay in the same room with you, and they should wear a face covering if they enter your room.

Clean your hands often

Wash your hands often with soap and water for at least 20 seconds or clean your hands with an alcohol-based hand sanitizer that contains 60-95% alcohol, covering all surfaces of your hands and rubbing them together until they feel dry. Soap and water should be used if your hands are visibly dirty. Avoid touching your eyes, nose, and mouth with unwashed hands.

Cover coughs and sneezes

Cover your mouth and nose with a tissue when you cough or sneeze. Throw used tissues in a lined trash can; immediately clean your hands.

Avoid sharing personal household items

You should not share dishes, drinking glasses, cups, eating utensils, towels, or bedding with other people or pets in your home. After using these items, they should be washed thoroughly with soap and water.

Clean all “high-touch” surfaces everyday

High touch surfaces include counters, tabletops, doorknobs, bathroom fixtures, toilets, phones, keyboards, tablets and bedside tables. Also, clean any surface that may have blood, stool, or bodily fluids on them. Use a household cleaning chemical, according to the label instructions. Labels contain instructions for safe and effective use of the cleaning product including precautions you should take when applying the product, such as wearing gloves and making sure you have good ventilation during use of the product.
